

MAPLEZ – Improved labels for the CXR8 dataset extracted with LLM

by [Ricardo Bigolin Lanfredi](#)

These labels were extracted for the paper [Enhancing Chest X-ray Datasets with Privacy-Preserving LLMs and Multi-Type Annotations: A Data-Driven Approach for Improved Classification](#). If you use these labels, please cite that paper in addition to the original CXR 8 paper. The new labels are stored [here](#), in files "[nih-llm-annotations_train.csv](#)", "[nih-llm-annotations_test.csv](#)", and "[nih-llm-annotations_val.csv](#)". The "[mimic-llm-annotations.csv](#)" file provides labels for the MIMIC-CXR dataset. More details can be found in [our GitHub repository](#).

Using the MAPLEZ labels

The outputs of the script will be stored in a CSV file.

For rows where "type_annotation" is "labels":

- -3 means uncertainty because stability was mentioned.
- -2 means not mentioned
- -1 means uncertainty because of other reasons
- 0 means absence mentioned
- 1 means presence mentioned

For rows where "type_annotation" is "probability":

- 101 means uncertainty because stability was mentioned.
- any other value represents a percentage probability of presence (0-100).

For rows where "type_annotation" is "severity":

- 1 means "mild"
- 2 means "moderate"
- 3 means "severe"
- -1 for when the label is absent, not mentioned, or severity is not mentioned.

For rows where "type_annotation" is "location", the output is a list with mentioned locations for each label, in lists separated by ";".
